

CAPABILITY DELIVERY MANAGEMENT SYSTEM

DISYS' Capability Delivery Management System (CDMS) platform enables DISYS to deliver superior quality throughout the entirety of a service engagement by monitoring the efficiency and production of resources provided.

Utilizing CDMS

The Capability Delivery Management System (CDMS) is the glue that binds together employee outputs into a manageable, searchable, secure, and accessible information environment. The dashboard allows transparency through the entirety of a project or program, as project data and knowledge is captured and encapsulated into our searchable information store.

Throughout the life of the project/program, DISYS manages key performance indicators (KPI's) in custom templates and a document management control, center designed by DISYS' Global Service Operation Center (GSOC)

CDMS manages Projects/Programs with specific focus on:

- Process/workflow Management
- Scorecard/Reporting
- Resource and financial lifecycle Management
- Risk Mitigation through KPI management
- Project Control through revenue and cost balancing
- Project Control through resource management
- Central repository with real time updates
- Collaboration
- Simplified data Capture

The CDMS Project center allows for knowledge and process sharing, and emphasizes team collaboration and contribution throughout the project lifecycle. With information from multiple projects accessible in a single source, data integrity and flexibility is maximized, and projects are run at the highest level of efficiency possible.

Benefits:

- Increased collaboration and project efficiency
- Improved productivity and control
- Improved access to information
- Clear and accessible KPI's
